SUMMARY

Software Engineering graduate from McMaster University who works across full-stack development and data engineering. Comfortable building on Google Cloud Platform (GCP) and BigQuery, containerizing services with Docker, and automating ETL jobs with Apache Airflow. Lately focused on getting large language models (LLMs) into production pipelines with a human reviewing the output before anything ships.

TECHNICAL SKILLS

Languages: Python, JavaScript (ES6+), TypeScript, SQL

Frameworks: React, Next.js, Node.js, Express.js, Prisma ORM

Cloud & Data: Google Cloud Platform (GCP), BigQuery, Looker Studio, Firebase, Supabase, Apache Airflow

Tools: PostgreSQL, Docker, Git, Playwright, Trigger.dev

Practices: Agile (Scrum), REST APIs, JWT Authentication, ETL Pipelines, CI/CD, Technical Documentation

EXPERIENCE

Software Engineer Intern — Bulk Buys

Brampton, ON | Jan 2023 – Apr 2023

- Automated the sync between Amazon repricing tools and Zoho One, cutting out manual data entry and saving the company \$6K+ a year
- Moved the team's Python services into Docker containers, which cut environment setup time and made the services easier to scale
- Worked directly with stakeholders to ship e-commerce platform features that improved day-to-day operations and the customer experience
- Wrote technical documentation, helped test and debug production releases, and took part in Scrum ceremonies

PROJECTS

Job Application Automator – Next.js, TypeScript, Supabase, Claude API, Playwright

2026 – In Development | app.kabirkenth.me

- Built and shipped a pipeline that pulls job listings from Adzuna, scores each one against the user's parsed resume with the Claude API (Haiku), and generates tailored ATS-safe resumes and cover letters as PDFs using react-pdf
- Runs on Next.js and Supabase (PostgreSQL, auth, row-level security, storage) with in-browser document editing, guarded status transitions, and email approval through Resend, so a person reviews every document before it goes out
- Currently building a Playwright worker on Railway that fills out application forms with the approved PDFs; nothing gets submitted without a screenshot review and explicit sign-off

AI-Powered Stock Analysis Pipeline – Python, BigQuery, Airflow, Gemini AI

2026

- Set up a containerized ELT pipeline with Apache Airflow and Docker that pulls daily market data and financial news for S&P 500 stocks
- Designed the Google BigQuery warehouse around idempotent loads so pipeline reruns never create duplicate records
- Used Google Gemini to turn raw news text into sentiment scores, then trained a Random Forest model on them to generate predictions
- Built a Looker Studio dashboard that tracks model performance and surfaces buy/sell signals, closing the loop between predictions and decisions

FreightSwipe – Full-Stack Logistics Platform (React, Node.js, PostgreSQL)

2025

- Built a logistics web app with React, Node.js, and PostgreSQL (Prisma ORM), secured with JSON Web Token (JWT) authentication
- Added a swipe-deck interface for real-time load matching, with separate dashboards for carriers and shippers
- Designed the REST APIs and containerized the whole stack with Docker so it deploys the same way everywhere

EDUCATION

McMaster University — Bachelor of Engineering, Software Engineering & Management

Hamilton, ON | Graduated Nov 2025

Relevant Coursework: Algorithms, Data Structures, Cloud Computing, Database Systems

Certifications: Google Data Analytics Professional Certificate (Coursera, In Progress); Computer Networking & Security (Alison, In Progress)
